

Fresher Bot Image Classification Log

```
Welcome to the NTU freshers chatbot. I'm here to answer any queries you may have about starting off at NTU.

You can ask me to identify any images of fruit as part of our healthy eating program at NTU. Just type "image" into the chat.
Also, feel free to ask me about today's weather!

Type "exit" at anytime to close
>
```

The image classification is intended to identify different fruits to promote healthy eating between university students. To select an image for the chat bot to classify, the user will type "image" into the chat to open a prompt to find the file directory.

The user will select an image from their computer and will send the file path to make a prediction.

```
That is most likely a: pineapple  
It is rich in vitamins and minerals!
```

The chat bot will then send its prediction back to the main program. In this example it was correct.

Here are some more examples from images not in the dataset:

```
That is most likely a: cherry  
It is rich in vitamins and minerals!
```

```
That is most likely a: strawberry  
It is rich in vitamins and minerals!
```

The image classification can get the correct answer with multiple fruits

```
That is most likely a: lime  
It is rich in vitamins and minerals!
```

It does however make mistakes with similar looking fruits
